Assignment 1 Author: Yuan Qu

Question 1

a.

First, prove that $\emptyset \in S$.

Obviously, we have $\emptyset \in E = \{1, 2, ..., n\}$, and $a(\emptyset) = \sum_{j \in \emptyset} = 0 \le b \in \mathbb{R}_+$ So, $\emptyset \in S$.

Second, prove that $X \subseteq Y \in S \Rightarrow X \in S$

$$Y \in S \Rightarrow a(Y) = \sum_{j \in Y} a_j \leqslant b$$

$$X \subseteq Y \Rightarrow a(X) = \sum_{j \in X} a_j = \sum_{i \in Y} a_i - \sum_{j \in Y \setminus X} a_j \leqslant \sum_{j \in Y} a_j \leqslant b$$

Date: 01/31/2017

So, this diffuse an independence system $\mathcal{F} \subseteq 2^E$

b.

According to the defination, we have

$$\mathbf{n} = 6 \Rightarrow S \subseteq E = \{1, 2, 3, 4, 5, 6\}$$
$$a = (1, 1, 1, 4, 4, 5), \mathbf{b} = 8 \Rightarrow a(S) = \sum_{j \in S} a_j \leq 8$$

According to the defination of rank, we have

$$r(X) = \max_{F \in \mathcal{F}} |F \cap X| = \max_{B \in \mathcal{B}_Y} |B|$$
, and $\rho(X) = \min_{B \in \mathcal{B}_Y} |B|$

We can find that

$$\mathcal{B}_X = \{\{1, 2, 3, 4\}, \{1, 2, 3, 5\}, \{1, 2, 3, 6\}, \{4, 5\}\}$$

So that we have r(X) = 4, $\rho(X) = 2$

c.

$$O(r(X)) = O(nlogn)$$

As the greedy algorithm, order the a from small to large, use the Best-in Greedy to select numbers from the smallest. So the complexity is O(nlogn)

d.

$$O(\rho(X)) = O(n^2)$$

Need to find all the subset of S So the complexity is $O(n^2)$

e.

As b. mentioned, $B_3 = \{1, 2, 3, 6\}$, $B_4 = \{4, 5\}$. If we use Best-in Greedy, we may lose the B_4 , because there is a solution when the first choice is 6.

Question 2

a

We have the job set E like following

Job	1	2	3	4	5	6	7
Due	3	2	4	1	4	4	6
Profit	2	3	4	3	3	6	7

The purpose is to find a independent subset $S\subseteq E$

The initialization of Best-in Greedy is sorting the jobs, as following

Job	7	6	3	5	4	2	1
Due	6	4	4	4	1	2	3
Profit	7	6	4	3	3	3	2

Then, as Best-in Greedy, the process would be

Date	1	2	3	4
Job	7	6	3	5
Due	6	4	4	4
Profit	7	6	4	3

The total profit would be: 7+6+4+3=20
